

# TONA HR AUDIO RECORDER 1.06 MANUAL

April 2018

The Tona audio recorder is a simple CPU efficient OSX program that allows to record in sampling rates up to 768Khz\*. Made specially for the RME ADI-2 Pro 2 channel AD converter, but can be used with any audio interface. It has some extra features that are very convenient in a recording session:

#### • AUX Send to VST plugins

Make a cue mix for the musicians with reverb or other effects, and choose to record the wet or dry signal.

#### • Small audio player embedded

Make audio bounces with VST plugins added, or use it for HD playback monitoring.

#### • Sample rate and I/O buffer sizes can be set in real time

Even when recording.

#### • 4 user presets

#### • High sample rate recording

Make 784Khz recordings\*.

#### • Processing of VST

Do not limit the HD signal as there is no blocking filter at 20Khz.

The VST plugin is usually blocking at 192Khz or lower, but the higher HD signal remains intact by using parallel processing.

A complete solution to high resolution recordings in 192, 352.8, 284 and 768 KHz.

Use it for LP vinyl ripping, or with a stereo recording setup.

\* Depending on your audio interface highest sample rate
